2-THIOINDOLES (SELENOINDOLES) AND RELATED DISULFIDES
(SELENIDES) WHICH INHIBIT PROTEIN TYROSINE KINASES
AND WHICH HAVE ANTITUMOR PROPERTIES

CROSS-REFERENCE TO RELATED APPLICATIONS

This application is a continuation-in-part of
co-pending application U.S. Serial Number 926,015,
10 filed August 6, 1992.

FIELD OF INVENTION

15 The present invention relates to substituted
2-thioindoles (selenoindoles) and other related
compounds, which we have unexpectedly found to be
potent inhibitors of the epidermal growth factor
receptor tyrosine kinase (EGF-TK) and other protein
20 tyrosine kinases, and which show antitumor activity.
The invention also relates to use of the compounds as
inhibitors of protein tyrosine kinases and as antitumor
agents.

25

BACKGROUND OF THE INVENTION

Protein phosphorylation is a critical mechanism
for regulating protein function in the signal
30 transduction pathway in normal and transformed cells.
Protein tyrosine kinases (PTK) are an important class
of phosphorylating enzymes which mediate this
signalling and thereby regulate cell growth and
proliferation. PTKs catalyze the transfer of the
35 terminal phosphate from ATP to the phenol of tyrosine
in substrate proteins. Some growth factor receptors,

-2-

protooncogenes and oncogene products possess PTK activity. The overexpression or inappropriate expression of normal or mutant kinases can result in the loss of growth control and the unregulated cell proliferation associated with malignancy. Small molecules which selectively inhibit these enzymes are, therefore, of therapeutic interest as mediators of cell growth and as antitumor agents.

In some growth factor dependent tumors, the growth factor signal transduction pathway employs the intrinsic tyrosine kinase activity of the growth factor receptor for autophosphorylation and the phosphorylation of specific cellular proteins involved in mitogenesis and cell proliferation. Specific inhibitors of PTKs have been identified previously. It has been previously demonstrated that by uncoupling the PTK from the signal transduction pathway, inhibitors of the growth factor receptor tyrosine kinases result therapeutically in antitumor activity. This antitumor activity has been demonstrated both in vitro and in vivo. Most known tyrosine kinase inhibitors are styrene-like small molecules in which the aromatic ring is hydroxylated, resembling tyrosine itself.

For example, the EGF-TK inhibitor erbstatin is reported to inhibit the growth of human epidermoid carcinoma A431 cells with an $IC_{50} = 3.6 \mu\text{g/mL}$ (J. Antibiot. 1986;39:170). Erbstatin also inhibits the growth of the human mammary carcinoma MCF-7 and some esophageal tumors in nude mice in a dose-dependent manner (Eur. J. Cancer 1990;26(6):722 and Japanese Patent 03,109,323). Another class of PTK inhibitor called the tyrphostins also potently inhibited the EGF-dependent growth of A431 cells in vitro (J. Med. Chem. 1989;32:2344; J. Med. Chem. 1991;34:1896). The antitumor activity of two tyrphostins has been verified in vivo in nude mice bearing human squamous cell

-3-

carcinoma MH-85 (Cancer Res. 1991;51:4430). In vitro and in vivo antitumor activity against A431 tumors has also been reported for a series of sulfonylbenzoyl nitrostyrenes (J. Med. Chem. 1991;34:2328) as TK inhibitors (J. Med. Chem. 1991;34:2328 and Helv. Chim. Acta 1992;75:696).

SUMMARY AND DETAILED DESCRIPTION

In one aspect, the invention relates to 2-thioindole (selenoindoles) and other related compounds that are potent inhibitors of epidermal growth factor receptor tyrosine kinase and other protein tyrosine kinases, and which have antitumor activity. Thus, the compounds are useful in dosage form as inhibitors of protein tyrosine kinases and as antitumor agents.

More particularly, the invention comprises 2-thioindole, 2-indolinethione, polysulfide, 2-selenoindole, 2-indolineselenone, and selenide compounds represented by the general Formulas I, IV, and XXXII

and pharmaceutically acceptable salts thereof, wherein

R_1 is a member selected from H, halogen, R, OH, OCOR, OR, CF_3 , NO_2 , NH_2 , NHR, COOH, CONHR, $(\text{CH}_2)_n\text{OH}$, $(\text{CH}_2)_n\text{OR}$, $(\text{CH}_2)_n\text{NH}_2$, $(\text{CH}_2)_n\text{NHR}$, and $(\text{CH}_2)_n\text{NRR}$, and further represents replacement in the ring of 1 or 2 ring methine (-CH-) atoms with aza (-N-) atoms;

bis[indolyl-3-acetic acid-(2)]disulfide,
bis[methylindolyl-3-acetate-(2)]trisulfide, and
bis[1-methylindolyl-3-acetic acid-(2)]disulfide.

In another aspect, the invention relates to indolinethione compounds of the above Formula IV which exist as tautomers of compounds of Formula I wherein R_4 represents SH or indolineselenone compounds of the above Formula XXXII which exist as tautomers of compounds of Formula I wherein R_4 represents SeH. The invention comprises the thione or selenone compounds in their racemic and optical isomer forms. The thione or selenone compounds produced in the (+) form can be resolved as their (+) and (-) enantiomorphous optical isomers by per se art-recognized conventional means such as fractional crystallization of salts formed from optically active acids, separation of the isomers by chiral chromatography, or the chiral catalytic reduction of precursors.

In another aspect, the invention relates to pharmaceutical compositions useful for inhibition of protein tyrosine kinases and for antitumor activity containing as an active agent in a pharmaceutically acceptable carrier a therapeutically effective amount of a compound selected from 2-thioindole, 2-indolinethione, polysulfide, 2-selenoindole,

R_3 is a member selected from H, lower alkyl and benzyl;

Y represents a benzene, pyridine, thiophene, furan, thiazole, or imidazole ring optionally substituted with a lower alkyl, COOH, OH, OCOR, NH_2 , CONHR, CONRR, OR, or NHR group; and

R_4 represents SH, S_oX , S_oQ , SeH, Se_oX , and Se_oQ , where o is 1, 2, or 3, X is a member selected from H, lower alkyl, benzyl, and benzene, pyridine, thiophene, furan, thiazole, and imidazole rings, and Q is another 2-thioindolyl or 2-selenoindolyl moiety of Formula I.

The invention comprises salt compounds formed by the basic or acidic thioindole compounds of the invention which form pharmaceutically acceptable salts with both organic and inorganic acids and/or organic and inorganic bases. Examples of suitable acids for salt formation are hydrochloric, sulfuric, phosphoric, acetic, citric, oxalic, malonic, salicylic, malic, fumaric, succinic, ascorbic, maleic, methanesulfonic, isethionic, and the like. Examples of suitable bases for salt formation are sodium and potassium carbonate, sodium and potassium hydroxide, ammonia, triethylamine, triethanolamine, and the like.

The compounds of Formulas I, IV, and XXXII can be prepared by the processes described in the following Reaction Schemes 1-11.

- 8 -

SCHEME 1

In Scheme 1, R₁-R₃ are as designated for Formula I. Oxidation of 3-substituted indoles II in DMSO/HCl gives good yields of 3-substituted indolin-2-ones III which are thiated (preferably with P₂S₅ and NaHCO₃ or Na₂CO₃) to yield 3-substituted 2-indolinethiones IV. These compounds can be converted to the corresponding disulfides V by treatment with mild oxidizing agents (e.g., FeCl₃), and also undergo spontaneous oxidation to V in solution in air.

- 9 -

SCHEME 2

5

10

15

20

In Scheme 2, R_1 - R_3 are as designated for Formula I. Treatment of 3-substituted indoles II with S_2Cl_2 gives mixtures of dimeric sulfides VI, where $n = 1-3$. These can be separated by chromatography, or more conveniently reduced to 2-indolinethiones IV with a mild reducing agent (preferably $NaBH_4$).

-10-

SCHEME 3

In Scheme 3, R_1 - R_3 are as designated for Formula I, and R represents $(CH_2)_nCOOH$, $(CH_2)_nCOOX$, $(CH_2)_nCONHX$, $(CH_2)_nSO_2X$, or $(CH_2)_nSO_2NX$, where n is from 0 to 4, and X is as designated for Formula I.

Treatment of 2-indolinones VII with diesters gives moderate yields of the isatylidene compounds VIII, which can be hydrogenated under acidic conditions to the 3-substituted indolin-2-ones III. Treatment of these as in Scheme 1 gives the desired compounds.

- 11 -

SCHEME 4

-12-

In Scheme 4, R_1 - R_4 , R and X are as designated for Formula I (except that X is not H). The ring-substituted oxindoles can be prepared by lithiation of the appropriately substituted ortho-toluidine derivatives, using CO_2 as both the N-protecting group and electrophile (Katritzky, Fan, Akutagawa, Wang, Heterocycles 1990;30:407). 2-Indolinones VII are thiated (preferably with P_2S_5 and $NaHCO_3$ or Na_2CO_3) to yield 2-indolinethiones IX. These compounds are deprotonated (typically with NaH in THF), and treated with an isocyanate to give 3-substituted 2-indolinethiones IV (where $R_2 = CONHX$). These compounds can be converted to the corresponding disulfides V as described in Scheme 1. The 3-substituted 2-indolinethiones IV can also react with alkylating agents (typically alkyl halides R-halogen) to give (X: where $R_4 = X$). Reaction of V with XSH gives mixed disulfides (XI: where $R_4 = SSX$).

-13-

SCHEME 5

In Scheme 5, R_1 and R_3 are as designated for Formula I and Y represents lower alkyl or a benzene, pyridine, thiophene, furan, thiazole, or imidazole ring, optionally substituted with a lower alkyl, $COOH$, OH , NH_2 , $CONHR$, OR , O , or NHR group. 2-Sulfonylmethyl anilines XII are treated sequentially with n-butyllithium and CS_2 , to give the disulfides XIII, which can be reduced to 2-indolinethiones XIV with a mild reducing agent (preferably $NaBH_4$).

-14-

SCHEME 6

In Scheme 6, R_1 and R_3 are as designated for Formula I. Deprotonation of substituted 2-indolinethiones **IX** (typically with NaH in THF), followed by treatment with an acyl azide, gives 3-acyl-substituted 2-indolinethiones **XV**, where R_5 represents H, lower alkyl, benzyl, or a benzene, pyridine, thiophene, furan, thiazole, or imidazole ring optionally substituted with a COOH, OH, NH_2 , CONHR, OR, NHR, or NRR group. Compounds **XV** can be converted into the disulfides **XVI** on mild oxidation (typically by treatment with I_2 or H_2O_2).

-15-

SCHEME 7

In Scheme 7, R is as designated for Formula I.

Substituted aromatic and heteroaromatic acids (e.g., XVII) are converted to the corresponding acid chlorides (preferably with SOCl₂), and then to the corresponding acyl azides (e.g., XVIII) with NaN₃. Rearrangement to give the isocyanates (e.g., XIX) is carried out in an inert solvent (preferably toluene or xylene). These isocyanates (e.g., XIX) are converted to the disulfides (XX) by reaction with the sodium salt of 1-methyl-2-indolinethiones as outlined in Scheme 4. In suitable cases, hydrolysis of esters (XX; R = COOMe) with a mild base (preferably K₂CO₃) gives the corresponding acids (XX; R = COOH).

-16-

SCHEME 8

In Scheme 8, R_1 and R_2 are as designated for Formula I, and R_6 and R_7 are individually H, lower alkyl, benzyl, or a benzene ring optionally substituted with up to two of the groups COOH, OH, NH_2 , CONHR, OR, NHR, or NRR. 2-Chloro-1-methylindole-3-carboxyl chloride, prepared either from indolin-2-one and COCl_2 or from 2-chloro-1-methylindole-3-carboxylic acid (XXI) and SOCl_2 , is reacted with amines HNR_6R_7 or their salts, in an inert solvent (preferably 1,2-dichloroethane or CH_2Cl_2) and a base, if necessary, to give the amides (XXII). These compounds are heated with MeSLi in polar aprotic solvents (preferably dimethylacetamide) in an inert atmosphere to give intermediate thiol carboxamides, which are oxidized, (preferably with H_2O_2) to give the desired disulfides (V).

25

30

35

-17-

SCHEME 9

In Scheme 9, R_1 , R_2 , R_3 , and R are as designated for Formula I. Reaction of acid chloride (XXIII) with amines gives amides (XXIV), where R_8 represents H, lower alkyl, benzyl, or a benzene ring optionally substituted with up to two of the groups $COOH$, OH , NH_2 , $CONHR$, OR , NHR , or NRR . Compounds (XXIV) can be converted to 2-thioindoles (XXV) by lithiation and quenching with methyl sulfide, followed by base hydrolysis (preferably with K_2CO_3). The 2-thioindoles (XXV) can be converted to the desired disulfides (V) by dealkylation (preferably with lithium thiomethoxide) and mild oxidation (preferably with I_2 or H_2O_2). Compounds (XXV) can also be alkylated with an alkyl halide (e.g., R_9Cl), where R_9 represents lower alkyl, benzyl, or benzyl optionally substituted with up to two of the groups $COOH$, OH , NH_2 , $CONHR$, OR , NHR , or NRR , and a base (preferably K_2CO_3).

- 18 -

SCHEME 10

-19-

In Scheme 10, R_1 is as designated for Formula I and R_6 and R_7 are individually H_1 lower alkyl, benzyl, or a benzene ring optionally substituted with up to two of the groups $COOH$, OH , NH_2 , $CONHR$, OR , NHR , or NRR .
5 R_3 is H or lower alkyl, and X = any halogen, preferably bromine or chlorine. Substituted 2-halo-3-indole carboxylic acids XXVII, prepared by oxidation of corresponding substituted 3-carboxaldehydes, are reacted with amines HNR_6R_7 or their salts in an inert
10 solvent (preferably 1,2-dichloroethane or CH_2Cl_2) and a base, if necessary, to give the amides XXX. These compounds are reacted with $MeSeLi$ in polar aprotic solvents (preferably dimethylacetamide) to give intermediate selenol carboxamides, which are oxidized
15 with H_2O_2 or $NaBO_4$ to give the desired diselenides XXIX. Alternatively, intermediate XXX, where $R_3 = H$, can be reacted with a haloalkyl amine, or its salt, where $Q = Cl, Br, I$ (preferably Cl) and R_8, R_9 are as defined in Formula I, but preferably R_8 and R_9 are H ,
20 alkyl, cycloalkyl, and $n = 1-4$ in a polar solvent (preferably acetone) and anhydrous metal carbonate (preferably cesium carbonate) to give intermediate XXXI which is converted to diselenide XXIX as described above for intermediate XXX. Additionally, intermediate
25 acid XXVII can be converted to the substituted 2-halo-3-indole carboxylic acid tertiary butyl ester XXVIII, which can be further reacted with $MeSeLi$ as described above for intermediate XXX to give the target substituted diselenide XXIX where $R_2 = COO$ -tertiarybutyl.

As indicated, the compounds of this invention that are basic can form acidic salts and those that are acidic can form basic salts. All such salts are within the scope of this invention and they can be prepared by conventional methods. For example, they can be prepared simply by contacting the acidic and basic entities, usually in a stoichiometric ratio, in either an aqueous, nonaqueous or partially aqueous medium, as appropriate. The salts are recovered either by filtration, by precipitation followed by filtration, by evaporation of the solvent, or in the case of aqueous solutions, by lyophilization, as appropriate.

The compounds of this invention are readily adapted to therapeutic use for the control of tyrosine kinase dependent diseases in mammals. Tyrosine kinase dependent diseases comprise hyperproliferative disorders which are initiated and/or maintained by aberrant tyrosine kinase enzyme activity. Tyrosine kinase inhibitors can therefore have beneficial therapeutic effects against aberrant cell growth disorders such as various cancers, atherosclerosis, angiogenesis (tumor growth/metastasis, diabetic retinopathy, for example), viral diseases (HIV infections, for example), and the like.

Tyrosine kinase dependent diseases further comprise cardiovascular diseases which are related to aberrant tyrosine kinase enzyme activity. Tyrosine kinase inhibitors can therefore have beneficial therapeutic effects against such cardiovascular diseases as restenosis. It should be understood that restenosis is an example of a cardiovascular disease which is dependent upon tyrosine kinase; one skilled in the art, however, will be aware of other examples of cardiovascular diseases which are dependent upon tyrosine kinase.

-22-

The compounds are administered either orally or parenterally, or topically as eye drops, in dosages ranging from about 0.1 to 10 mg/kg of body weight per day in single or divided doses. Of course, in particular situations, at the discretion of the attending physician, doses outside of this range will be used.

The compounds of this invention can be administered in a wide variety of different dosage forms, i.e., they may be combined with various pharmaceutically acceptable inert carriers in the form of tablets, capsules, lozenges, troches, hard candies, powders, sprays, elixirs, syrups, injectable or eye drop solution, and the like. Such carriers include solid diluents or fillers, sterile aqueous media, and various nontoxic organic solvents.

For purposes of oral administration, tablets containing various excipients such as sodium citrate, calcium carbonate, and calcium phosphate are employed along with various disintegrants such as starch and preferably potato or tapioca starch, alginic acid, and certain complex silicates, together with binding agents such as polyvinylpyrrolidone, sucrose, gelatin, and acacia. Additionally, lubrication agents such as magnesium stearate, sodium lauryl sulfate, and talc are often very useful for tableting purposes. Solid compositions of similar type are also employed as fillers in soft- and hard-filled gelatin capsules; preferred materials in this connection also include lactose or milk sugar as well as high molecular weight polyethylene glycols. When aqueous suspensions and/or elixirs are desired for oral administration, the essential active ingredient therein can be combined with various sweetening agents, flavoring agents, coloring agents, emulsifying agents, and/or suspending agents as well as such diluents as water, ethanol,

-23-

propylene glycol, glycerin, and various like combinations thereof.

For purposes of parenteral administration, solutions in sesame or peanut oil or in aqueous propylene glycol can be employed, as well as sterile aqueous solutions of the corresponding water soluble, alkali metal, or alkaline earth metal salts previously enumerated. Such aqueous solution should be suitably buffered, if necessary, and the liquid diluent first rendered isotonic with sufficient saline or glucose. These particular aqueous solutions are suitable for intravenous, intramuscular, subcutaneous and intraperitoneal injection purposes. In this connection, the sterile aqueous media employed are all readily obtainable by standard techniques well known to those skilled in the art.

For purposes of topical administration, dilute sterile, aqueous solutions (usually in about 0.1% to 5% concentration), otherwise similar to the above parenteral solutions, are prepared in containers suitable for dropwise administration to the eye.

In a pharmaceutical composition comprising a compound of Formula I, or a pharmaceutically acceptable salt thereof, the weight ratio of carrier to active ingredient will normally be in the range from 1:4 to 4:1, and preferably 1:2 to 2:1. However, in any given case, the ratio chosen will depend on such factors as the solubility of the active component, the dosage contemplated and the precise route of administration.

The following Table 1 sets out physical data for 137 compounds within the general Formula I, representative of it, and preparable by the processes of the invention.

EXAMPLES

The invention and the best mode for practicing the same are illustrated by the following Examples A-K.

5

EXAMPLE A

Preparation of Compounds 15, 17, 65, and 46 of Table 1 by the Method Outlined in Scheme 1

Concentrated HCl (16.6 mL) was added dropwise with stirring, over 10 minutes, to a solution of 4-(3-indolyl)butanoic acid [II: $R_1 = R_3 = H$, $R_2 = (CH_2)_3COOH$] (2.00 g) in DMSO (7.0 mL) at room temperature (method of Savige WE, Fontana A, J. Chem. Soc. Chem. Commun. 1976:599). After 15 minutes reaction, the mixture was diluted with water (80 mL) and extracted with EtOAc (4 x 100 mL). Removal of the solvent gave crude 4-(2-oxo-3-indoliny)butanoic acid [III: $R_1 = R_3 = H$, $R_2 = (CH_2)_3COOH$] (2.07 g, 96%) as a green-brown solid; mp (water) 169-171°C (Hinman RL, Bauman CP, J. Org. Chem. 1964;29:1206 record mp 170-171°C).

Acetyl chloride (10 mL) was added dropwise with stirring to an ice-cooled solution of the above crude acid [III: $R_1 = R_3 = H$, $R_2 = (CH_2)_3COOH$] (2.05 g) in dry MeOH (50 mL), and the mixture stirred at 20°C for 18 hours. The solvent was removed, and repeated evaporation from MeOH yielded a brown oil, which was dissolved in $CHCl_3$ (100 mL) and washed with water (2 x 100 mL). Removal of the solvent gave crude methyl 4-(2-oxo-3-indoliny)butanoate [III: $R_1 = R_3 = H$, $R_2 = (CH_2)_3COOMe$] (2.20 g) as an oil. A pure sample was obtained by chromatography on silica gel and elution with EtOAc/light petroleum (1:2) as a pale yellow oil.

EXAMPLE B

Preparation of Compounds 1, 29, 30, and 31 of Table 1
by the Method Outlined in Scheme 2

A solution of purified S_2Cl_2 (0.50 mL) in THF
5 (20 mL) was added dropwise to a stirred, ice-cooled
solution of 3-indolylacetic acid [II: $R_1 = R_3 = H$,
 $R_2 = CH_2COOH$] (2.20 g) in dry THF (30 mL) (method of
Wieland T, Wieburg O, Fischer E, Korlein G, Annalen
1954;587:146). After 30 minutes at 20°C the solvent
10 was removed, and the residue was crystallized from
aqueous acetic acid to give a yellow solid (1.00 g).
Recrystallization of this solid from aqueous MeOH,
followed by further crystallization from EtOAc-benzene
gave bis[indolyl-3-acetic acid-(2)]trisulfide [VI:
15 $R_1 = R_3 = H$, $R_2 = CH_2COOH$, $n = 3$] (30) as a yellow
powder (80 mg, 3%); mp 199-202°C.

A stirred solution of methyl 2-acetoxy-4-bromomethylbenzoate (Regnier G, Canevari R, Le Douarec J-C, Bull. Soc. Chim. Fr. 1966:2821) (10.7 g) and hexamethylenetetramine (17.1 g) in CHCl_3 (150 mL) was refluxed for 5 hours, then the solvent was removed (method of Meindl W, v Angerer E, Ruckdeschel G, Schonenberger H, Arch. Pharm. (Weinheim) 1982;315:941). The residue was stirred with MeOH (60 mL) and concentrated HCl (30 mL) at 20°C for 10 minutes, then the solvent removed. Treatment of the solid residue twice more with HCl/MeOH and evaporation gave a solid, which was washed with CH_2Cl_2 , then treated with saturated KHCO_3 solution. The base was extracted with EtOAc and CH_2Cl_2 , then the solvents removed. The crude hydrochloride salt (5.30 g, 70% pure) was precipitated from an ethereal solution of the base upon the addition of HCl gas. A subsample of the

EXAMPLE C

Preparation of Compounds 5 and 33 of Table 1 by the Method Outlined in Scheme 3

20 1-Methyl-2-indolinone [VII: $\text{R}_1 = \text{H}, \text{R}_3 = \text{Me}$] was
condensed with diethyl oxalate in NaOEt/EtOH , to give
ethyl 1-methyl isatylidenehydroxyacetate
[VIII: $\text{R}_1 = \text{H}, \text{R}_3 = \text{Me}, \text{R} = \text{COOEt}$] (82% yield);
mp 62-64°C (according to the method of Porter JC,
25 Robinson R, Wyler M, J. Chem. Soc. 1941:620, who report
mp 81°C). The above acetate [VIII: $\text{R}_1 = \text{H}, \text{R}_3 = \text{Me},$
 $\text{R} = \text{COOEt}$] (2.30 g) was hydrogenated in glacial AcOH
(150 mL) containing concentrated H_2SO_4 (1 mL) and 5%
Pd/C catalyst (5 g) for 1 day. The reaction mixture
30 was filtered onto NaOAc (4 g) and the solvent removed
under reduced pressure. The residue was partitioned
between CH_2Cl_2 and water, then the aqueous phase
re-extracted with CH_2Cl_2 . The CH_2Cl_2 extracts wer
combined, washed with water, the solvent removed, and

the residue was chromatographed on silica gel. Elution with CH_2Cl_2 gave ethyl 2-(1-methyl-2-oxo-3-indoliny)-acetate [III: $\text{R}_1 = \text{H}$, $\text{R}_2 = \text{CH}_2\text{COOEt}$, $\text{R}_3 = \text{Me}$] as an oil (1.23 g, 57%).

EXAMPLE D

Preparation of Compounds 21-23 and 70 of Table 1 by the Method Outlined in Scheme 4

Powdered Na_2CO_3 (0.70 g, 6.61 mmol) was added to a
20 suspension of P_2S_5 (2.93 g, 6.61 mmol) in THF (40 mL)
and the mixture was stirred vigorously at 20°C until
homogeneous, and gas evolution had ceased (15 minutes).
A solution of 1-methyl-2-indolinone [VII:
 $R_1 = R_3 = \text{Me}$] (0.80 g, 5.50 mmol) in THF (10 mL) was
25 added and stirring was continued for 18 hours. After
pouring into brine, the mixture was extracted into
EtOAc, worked up, and chromatographed on silica.
Elution with EtOAc/petroleum ether (1:4) gave
1-methyl-2-indolinethione [IX: $R_1 = R_3 = \text{Me}$] (0.71 g,
30 87%); mp 108-109°C (Hino T, Tsuneoka K, Nakagawa M,
Akaboshi S, Chem. Pharm. Bull. 1969;17:550 record
109-111°C).

A solution of the above 1-methyl-2-indolinethione
(4.1 g) in THF (150 mL) was treated dropwise over

-102-

15 minutes with an ice-cooled suspension of NaH (57%, 1.4 g) in THF (100 mL). The mixture was stirred for 30 minutes, then a solution of phenyl isocyanate (3.5 g) in THF (50 mL) was added, and stirring continued for 3 hours at 20°C. The solvent was removed under vacuum, then the residue decomposed with ice-HCl, and extracted in CH₂Cl₂. Removal of the solvent gave an oil (6.0 g), which crystallized from ether. Two recrystallizations from THF-ether gave N-phenyl (1-methyl-2-thioxo-3-indoliny)carboxamide [IV: R₁ = H, R₂ = CONHPh, R₃ = Me] (21) (2.8 g, 39%) as a pale yellow solid; mp 149-151°C.

A suspension of this compound (33 g, 0.13 mol) and NaBH₄ (5 g) in dioxane (400 mL) was heated under reflux for 5 hours, and the solution was concentrated. After cooling, water was added and the resulting mixture was extracted with EtOAc. The organic layer was washed twice with aqueous K₂CO₃ and water, and dried (Na₂SO₄). Removal of the solvent gave N,2,5-trimethylaniline (17.6 g, 99% yield) as an oil, which was used directly.

¹H NMR (CDCl₃): δ 6.93 (1H, d, J = 7.4 Hz, H-3), 6.49 (1H, d, J = 7.6 Hz, H-4), 6.44 (1H, s, H-6), 3.72, (1H, s, NH), 2.88 (3H, s, NCH₃), 2.31 (3H, s, CH₃), and 2.09 (3H, s, CH₃).

A solution of 2,4,6-trimethylaniline (6.86 g, 5 mmol) in dry THF (100 mL) under an atmosphere of N₂ was cooled to -78°C and n-butyllithium (21 mL, 2.5 M solution in hexanes) was added dropwise. The mixture was allowed to warm to 0°C, and dry CO₂ gas was bubbled in for 2-3 minutes. The excess CO₂ was removed under

vacuum, and after the addition of further THF to replace that lost by evaporation, the solution was recooled to -78°C . n-Butyllithium (22 mL, 2.5 M solution in hexanes) was again added dropwise, and the temperature was then allowed to rise slowly to -10°C where a deep red colored solution was obtained. After a further 30 minutes at that temperature, the mixture was again recooled to -78°C and CO_2 gas was bubbled in until the red color disappeared. The reaction mixture was allowed to warm to 20°C , and after removal of the solvent, 0.1 M HCL (50 mL) was added to initiate both deprotection of the nitrogen and ring-closure. The resulting mixture was extracted with EtOAc, and this was then washed successively with 0.1 M HCL, water, and dilute aqueous Na_2CO_3 . After drying (Na_2SO_4), the solvent was removed under vacuum, to leave an oil which was purified by chromatography on Al_2O_3 to give 1,6-dimethyl-2-indolinone (3.37 g, 42% yield) [VII: $\text{R}_1 = 6\text{-Me}$; $\text{R}_3 = \text{Me}$]; mp (hexane) $94.5\text{-}96^{\circ}\text{C}$.

Compound 90 of Table 1

A solution of 4-methoxy-1-methyl-2-oxindole [VII: $R_1 = 4\text{-OMe}$, $R_3 = \text{Me}$] (1.20 g, 6.77 mmol) in 48% HBr/glacial AcOH (40 mL) was heated under reflux for 6 hours, then poured into water. The precipitate of crude phenol was filtered off, washed well with water and dried, then acetylated with Ac₂O/pyridine for 1 hour at 20°C. Solvents were removed under reduced pressure, and the residue was partitioned between EtOAc and 3N HCl. Chromatography of the organic residue on silica gel, eluting with EtOAc/petroleum ether gave 4-acetoxy-1-methyl-2-oxindole [VII: $R_1 = 4\text{-OAc}$, $R_3 = \text{Me}$] (75% yield); mp 109-111°C.

Alternate Preparation of Compound 97 of Table 1

15 A mixture of 20 g (136 mmol) of 1-methyl-
2-indolinone and 250 mL of dichloroethane was sealed in
a 500 mL stainless steel autoclave. The reactor was
cooled to less than -10°C and 60 g of phosgene was
distilled into the vessel. The reactor was sealed and
20 heated to 80°C while rocking. After 1 hour, the
reactor was cooled to room temperature, vented, and
purged with nitrogen. The reactor was opened and the
solution was rinsed out with fresh dichloromethane.
The dichloroethane solution from the rinsed reactor was
25 concentrated to a purple solid. The solid was
dissolved into 300 mL of dichloromethane and the
solution was cooled in an ice bath. Into the cold
solution was bubbled anhydrated methylamine at a
moderate rate over a 50-minute period. The mixture was
30 washed with water (2 x 300 mL) and brine, dried
(Na_2SO_4), and concentrated to ca. 150 mL. The solution
was purified by flash silica gel chromatography
(7.5 x 13 cm bed) eluting with 1.6 L dichloromethane,
2 L 2%, then 2 L 5% acetone/dichloromethane, with

-130-

500 mL fractions collected. Impure early product fractions were combined, concentrated, and recrystallized from 40 mL ethanol/12 mL pet ether to give 3.04 g of 2-chloro-1-methylindole-

5 3-N-methylcarboxamide [XXII: $R_6 = H$, $R_7 = CH_3$]; mp 148-151°C. Pure product fractions were combined and concentrated to give 16.41 g of additional product as a pale yellow solid; mp 150-151°C. Total yield = 19.45 g (64%).

10 Reaction of 9.30 g (41.8 mmol) of the above carboxamide was carried out with 129.5 mmol of MeSLi in 36 mL of DMA. After heating at 60°C for 7 hours, the clear amber solution was cooled in an ice bath and treated slowly with 150 mL of 5% aqueous HCl. The
15 resultant suspension was diluted with ca. 150 mL of dichloromethane, and the mixture was stirred for 1 hour. The layers were separated, and the aqueous phase was extracted twice more. The combined organic
20 extracts were washed with water (3 x 200 mL), then brine, dried $MgSO_4$, and concentrated to a residue that was pumped at 0.05 mm for 1 hour to leave 12.5 g of an orange solid. The solid was suspended into 100 mL of HOAc and 50 mL of water, and with vigorous stirring the
25 suspension was treated with 12.85 g of sodium perborate. The thick suspension was stirred for ca. 30 minutes, then filtered using 10% methanol in water to aid in the transfer. The solids were washed well with water, then with ether, and air dried. Further
30 drying at 200 mm/65°C/overnight over P_2O_5 afforded 6.38 g (70%) of pure bis[N-methyl 1-methylindolyl-3-carboxamide-(2)]disulfide (97) [V : $R_2 = CONHCH_3$]; mp 186-187°C.

EXAMPLE E

20 Preparation of Compounds 19 and 83 of Table 1 by the Method of Scheme 4

A mixture of 2-amino-3-methylpyridine (43.28 g, 0.4 mol) and benzotriazole (47.65 g, 0.4 mol) in EtOH (500 mL) was treated over 5 minutes with formaldehyde (32.2 g of 37% solution, 0.4 mol). The mixture was stirred at 20°C overnight, then cooled and filtered to give 2-[(1-benzotriazolyl)methyl]-3-methyl pyridine (30 g, 31%). A sample was crystallized from EtOH; mp 175-177°C.

30 1H NMR ($CDCl_3$): δ 8.10 (1H, d, $J = 5$ Hz, H-8), 8.10 and 8.00 (2H, 2d, $J = 8$ Hz, H-4',7'), 7.45 and 7.33 (2H, 2t, $J = 8$ Hz, H-5',6'), 7.25 (1H, d, $J = 7$ Hz, H-4), 6.54 (1H, dd, $J = 7.5$ Hz, H-5), 6.47 (2H, d,

-132-

$J = 7$ Hz, CH_2), 5.38 (1H, t, $J = 7$ Hz, NH), 2.07 (3H, s, CH_3).

Crude 2-[(1-benzotriazolyl)methyl]-3-methylpyridine (30 g, 125 mmol) was suspended in dioxan (400 mL) and treated with NaBH_4 (5 g, 130 mmol). The mixture was heated under reflux for 8 hours, then the majority of the solvent was removed under reduced pressure. The residue was partitioned between toluene and water, and the organic layer was washed successively with dilute NaOH solution and water, and dried. Removal of the solvent gave 2-methylamino-3-methylpyridine as an oil (12.8 g, 84%).

^1H NMR (CDCl_3): δ 8.04 (1H, d, $J = 5.1$ Hz, H-6), 7.19 (1H, d, $J = 7.1$ Hz, H-4), 6.50 (1H, dd, $J = 7.1$, 5.1 Hz, 5-H), 4.15 (1H, m, NH), 3.03 (3H, d, $J = 4.5$ Hz, CH_3N), 2.06 (3H, s, CH_3).

^{13}C NMR (CDCl_3): δ 157.3 (C-2), 145.0 (C-8), 136.1 (C-4), 116.4 (C-3), 111.9 (C-5), 28.3 (CH_2) and 16.5 (CH_3).

A solution of the above pyridine (6.1 g, 50 mmol) in dry THF (150 mL) was cooled to -78°C under dry N_2 , and n-BuLi (19.6 mL of a 2.5 M solution in hexanes, 50 mmol) was added dropwise, followed by t-BuLi (32 mL of a 1.7 M in pentane, 55 mmol). The resulting mixture was allowed to warm to -20°C and maintained at that temperature for 30 minutes before being recooled to -78°C and treated with dry CO_2 gas until the mixture was decolorized. After warming to 20°C , the mixture was acidified with dilute HCl, and the solvent was removed under reduced pressure. The residue was dissolved in EtOH (100 mL) containing p-TsOH (100 mg), heated under reflux for 3 hours to effect ring closure, and neutralized with aqueous ammonia. Solvent was then removed, and the residue was worked up in EtOAc to give

-133-

an oil, which was extracted with hot hexane, charcoaled, and filtered through celite. Concentration of the solution and cooled, gave 1-methyl-7-aza-2-indolinone (1,3-dihydro-1-methyl-2H-pyrrolo-

5 (2,3-bipyridin-2-one) [VII: $R_1 = 7\text{-aza}$, $R_3 = \text{Me}$] (1.2 g, 15%); mp (hexane) 94-96°C.

^1H NMR (CDCl_3): δ 8.15 (1H, d, $J = 5.3$ Hz, H-8), 7.48 (1H, d, $J = 7.2$ Hz, H-4), 8.94 (1H, dd, $J = 7.2$, 5.3 Hz, H-5), 3.53 (2H, s, CH_2), 3.29 (3H, s, CH_3).

10 ^{13}C NMR (CDCl_3): δ 174.1 (C-2), 158.1 (C-7a), 146.6 (C-8), 131.3 (C-4), 119.0 (C-3a), 117.8 (C-5), 34.6 (CH_2), 25.1 (CH_3).

P_2S_5 (3.80 g, 8.10 mmol) was added to a vigorously stirred suspension of Na_2CO_3 (0.88 g, 8.10 mmol) in THF 15 (30 mL). After the mixture had become homogeneous (ca. 15 minutes), a solution of 1-methyl-7-aza-2-indolinone [VII: $R_1 = 7\text{-aza}$, $R_3 = \text{Me}$] (1.00 g) in THF (10 mL) was added and stirring was continued for 18 hours at 20°C. Solvent was removed under reduced 20 pressure, and the residue was partitioned between EtOAc and water. Workup of the organic layer, and chromatography of the residue on silica gel (elution with EtOAc/petroleum ether (1:5)) gave 1-methyl-7-aza-2-indolinethione [IX: $R_1 = 7\text{-aza}$, $R_3 = \text{Me}$] (0.81 g, 73%); mp (EtOAc/petroleum ether) 130-133°C.

25 ^1H NMR (CDCl_3): δ 8.28 (1H, dd, $J = 5.2$, 0.6 Hz, H-6), 7.57 (1H, dd, $J = 7.3$, 0.6 Hz, H-4), 7.07 (1H, dd, $J = 7.3$, 5.2 Hz, H-5), 4.06 (2H, s, H-3), 3.66 (3H, s, N- CH_3).

30 ^{13}C NMR: δ 201.70 (C-2), 159.21 (s), 147.22 (d), 131.39 (d), 123.20 (s), 119.34 (d), 46.96 (C-3), 30.02 (N- CH_3).

A solution of the above thione (0.70 g, 4.26 mmol) in THF (5 mL) was added dropwise over 5 minutes under N_2 to an ice-cooled suspension of NaH (0.2 g of a 60% w/w dispersion in oil, 6.11 mmol). After gas evolution had ceased (5 minutes), phenyl isocyanate (0.47 mL, 4.25 mmol) was added, and stirring was continued for 1 hour at 20°C. Aqueous 1N HCl was then added, and the mixture was extracted with EtOAc. The organic layer was worked up, and the residue was chromatographed on silica gel. Elution with EtOAc/petroleum ether (1:1) and EtOAc gave foreruns, while elution with EtOAc/MeOH (10:1) gave N-phenyl (1-methyl-7-aza-2-thioxo-3-indoliny)carboxamide (19) [IV: $R_1 = 7\text{-aza}$, $R_2 = \text{CONHPh}$, $R_3 = \text{Me}$] as a fluorescent green solid (0.67 g, 55% yield); mp (after trituration with MeOH) 162-164°C (dec).

EXAMPLE H

Preparation of Compounds 104 and 105 of Table 1 by the Method Outlined in Scheme 7

10 A solution of monomethyl terephthalate
[XVII: 4-COOMe] (1.32 g, 7.33 mmol) and DMF (1 drop)
in SOCl₂ (30 mL) was heated under reflux for
45 minutes, before concentration to dryness under
reduced pressure. The residue was dissolved in benzene
15 and evaporated to dryness again. The crude acid
chloride was dissolved in dry Me₂CO (20 mL), cooled to
0°C, and treated with a solution of NaN₃ (0.52 g,
8.00 mmol) in water (3 mL). After 20 minutes the
solution was diluted with water, extracted with CH₂Cl₂,
20 and worked up to give the crude acyl azide
[XVIII: 4-COOMe], which was immediately dissolved in
dry toluene (25 mL) and heated under reflux under N₂
for 2 hours. Concentration to dryness under reduced
pressure afforded the isocyanate [XIX: 4-COOMe] which
25 was used directly.

A solution of 1-methyl-2-indolinethione
[IV: R₁,R₂ = H, R₃ = CH₃] (1.00 g, 6.13 mmol) in THF
(2 mL) was added under N₂ to a suspension of NaH
(0.26 g of 60% w/w dispersion in mineral oil,
30 6.50 mmol) in THF (15 mL). After gas evolution had
ceased (5 minutes), a solution of the above crude
isocyanate in THF (10 mL) was added, and the solution
was stirred at 20°C for a further 1 hour. The mixture
was acidified with 3N HCl, extracted with EtOAc and

-141-

worked up to give an oily solid. Chromatography on silica gel, eluting with EtOAc, afforded a greenish solid. This was dissolved in MeOH and treated with 30% H₂O₂ (0.20 mL), and the resulting yellow precipitate was filtered off and washed well with MeOH to give 2,2'-dithiobis[N-(4'-carbomethoxy)phenyl-1-methylindolyl-3-carboxamide] (104) [XX: R = 4-COOMe] (0.74 g, 35%); mp 184-186°C.

EXAMPLE I

Preparation of Compound 111 of Table 1 by the Method Outlined in Scheme 8.

A solution of 2-chloro-1-methylindole-3-carboxylic acid [XXI] (Marchetti L, Andreani A, Ann. Chim. (Rome) 1973;63:681) (0.95 g, 4.52 mmol) and SOCl₂ (0.99 mL, 13 mmol) in 1,2-dichloroethane (100 mL) containing DMF (1 drop) was heated under reflux under N₂ for 2 hours, then concentrated to dryness. The residue was dissolved in CH₂Cl₂ (50 mL) and treated with a slurry of methyl 4-(aminomethyl)benzoate hydrochloride (Nair MG, Baugh CM, J. Org. Chem. 1973;38:2185) (1.00 g, 4.98 mmol) and Et₃N (1.58 mL, 11 mmol) in CH₂Cl₂ (50 mL). After vigorous stirring at 20°C for 24 hours, the mixture was washed with water and the organic portion worked up to give N-(4'-carbomethoxy)-benzyl 2-chloro-1-methylindole-3-carboxamide [XXII: R₆ = H, R₇ = CH₂Ph{4-COOME}] (1.40 g, 86%) which crystallized from aqueous acetone; mp 108-110°C. ¹H NMR ((CD₃)₂SO): δ 8.38 (1H, t, $J = 5.8$ Hz, CONHCH₂), 7.95 (2H, d, $J = 7.9$ Hz, H-2',6'), 7.91 (1H, d, $J = 7.8$ Hz, H-4), 7.56 (1H, d, $J = 7.9$ Hz, H-7), 7.52

10 Preparation of Compound 125 of Table 1 by the Method Outlined in Scheme 9

Reaction of 3-chlorocarbonyl-1-(phenylsulfonyl)-indole [XXIII] (Ketcha DM, Gribble GW, J. Org. Chem. 1985;50:5451-5457) with an excess of benzylamine in CH₂Cl₂ (method of Ketcha and Gribble) gave N-benzyl-1-(phenylsulfonyl)indole-3-carboxamide [XXIV: R₈ = CH₂Ph]; mp (MeOH) 188-189°C.

15 ^1H NMR (CDCl₃): δ 8.05 (1H, s, H-2), 8.03-7.86 (4H, m, ArH), 7.56-7.26 (10H, m, ArH), 6.43 (1H, m, NH), 4.64 (2H, d, J = 5.7 Hz, CH₂).

C, 67.7; H, 4.5; N, 7.2; S, 8.2%.

Found: C, 67.4; H, 4.8; N, 7.1; S, 8.2%.

25 A solution of the above N-benzyl-1-(phenylsulfonyl)indole-3-carboxamide [XXIV: R₈ = CH₂Ph] (4.2 g, 11 mmol) in dry THF (200 mL) was treated at -78°C with a solution of 2.5 M n-BuLi in hexanes (9.1 mL, 23 mmol), and the stirred mixture was allowed to warm to -20°C for 15 minutes, before being re-cooled to -78°C, when it was treated with methyldisulfide (2.5 mL, 28 mmol). The mixture was allowed to warm to 20°C, then quenched with water (25 mL). Volatiles were removed under reduced pressure, and the residue was extracted with EtOAc. Workup of the organic layer gave

30

-161-

a crude product. This was dissolved in MeOH (300 mL), mixed with a solution of K_2CO_3 (6.9 g, 50 mmol) in water (125 mL), and heated under gentle reflux under N_2 for 2 hours to ensure complete hydrolysis of the phenylsulfonyl group (J. Org. Chem. 1985;50:5451-5457). MeOH was removed under reduced pressure, and the residue was diluted with water and extracted with CH_2Cl_2 . Chromatography of the resulting oil on Al_2O_3 (eluting with CH_2Cl_2) gave *N*-benzyl-2-(methylthio)-indole-3-carboxamide [XXV: $R_8 = CH_2Ph$] (2.8 g, 88% yield) as an oil.

1H NMR ($CDCl_3$): δ 10.65 (1H, s, H-1), 8.29 (d, $J = 5.1$ Hz, H-4), 7.87 (1H, t, $J = 5.6$ Hz, CONH), 7.34-7.08 (8H, m, ArH), 4.73 (2H, d, $J = 5.6$ Hz, CH_2), 2.33 (3H, s, SMe).

A solution of the above *N*-benzyl-2-(methylthio)-indole-3-carboxamide [XXV: $R = CH_2Ph$] (0.85 g, 2.87 mmol) in DMA (5 mL) was added under N_2 to a stirred suspension of MeSLi (0.93 g, 17.2 mmol) in DMA (10 mL). After warming at 80°C for 6 hours, the mixture was acidified with 3N HCl, extracted with CH_2Cl_2 , and worked up. Traces of DMA were removed under high vacuum, and the residue was dissolved in MeOH (15 mL) and treated dropwise with H_2O_2 (0.5 mL of 30% solution). After chilling at -30°C overnight, the precipitate was filtered off to give 2,2'-dithiobis[*N*-benzylindolyl-3-carboxamide] (125) [V: $R_1 = R_3 = H$, $R_2 = CONHCH_2Ph$], (74%); mp 203-205°C.

Compound 128 of Table 1

A solution of 2-(methylthio)-*N*-phenyl-1*H*-indole-3-carboxamide [XXV: $R_8 = H$] (1.8 g, 6.4 mmol) in EtOH (400 mL) was treated with 3-(dimethylamino)propyl chloride hydrochloride (10.0 g, 64 mmol) and K_2CO_3 (13 g, 96 mmol) and heated under reflux for 3 hours. A further 10 equivalents of the reagents were then added, and the mixture was heated under reflux for a further 48 hours. EtOH was removed under reduced pressure, and the residue was diluted with water to give crude product. This was chromatographed on alumina, eluting with CH_2Cl_2 containing 0.2% MeOH, to give 1-[3-(dimethylamino)propyl]-2-(methylthio)-*N*-phenyl-1*H*-indole-3-carboxamide [XXVI: $R_8 = H$, $R_9 = (CH_2)_3NMe_2$] (0.49 g, 21%) as an oil.

EXAMPLE K

Preparation of Compound 129 of Table 1 by the Method Outlined in Scheme 10

To a stirred 25°C solution of 41 mL (558 mmol) of DMF and 75 mL of dichloromethane was added dropwise a solution of 133.5 g (465 mmol) of $POBr_3$ in 100 mL of dichloromethane at such a rate to maintain a gentle reflux via the exothermic reaction (ca. 1 hour). The resulting thick tan suspension was stirred vigorously for 10 minutes, then treated dropwise over 20 minutes with a solution of 27.38 g (186 mmol) of 1-methyl-2-indolinone [VII: $R_1 = H$, $R_3 = CH_3$] in 55 mL of dichloromethane. The mixture was heated at reflux for 3.5 hours, cooled to 25°C, and the supernatant was decanted and concentrated to a thick reddish brown oil. This was combined with the solids above and treated

-167-

very cautiously with portionwise addition of ca. 20 g of ice, then with 112 g of 50% (w/w) aqueous NaOH, all the while keeping the temperature between 30-40°C (pH = 3). An additional 20 g of 50% NaOH, then 100 mL of ice water were added, and the precipitate was collected by filtration. The solids were washed well with water, then dried over P₂O₅ to leave 42.6 g of crude bromoaldehyde; mp 92-97°C. The solids were dissolved in ca. 65 mL of dichloromethane and the solution filtered over 165 g of flash silica gel placed in a 600 mL sintered glass funnel. The frit was washed with dichloromethane until all the product had eluted. The combined product fractions were concentrated to leave 34.66 g (78%) of nearly pure 2-bromo-1-methylindole-3-carboxaldehyde [XXVI: R₁ = H, R₃ = CH₃, X = Br]; mp 110-112° which was used directly in the next reaction.

To a vigorously stirred solution of 2.38 g (10 mmol) of 2-bromo-1-methylindole-3-carboxaldehyde [XXVI: R₁ = H, R₃ = CH₃, X = Br], 10 mL of 2-methyl-2-butene, and 40 mL of p-dioxane at 25°C was added dropwise over ca. 15 minutes a solution of 5 g (55 mmol) of sodium chlorite and 5 g (36 mmol) of NaH₂PO₄·H₂O in 25 mL of water. The solution was maintained at 25°C. After 3.5 hours, the mixture was treated with an additional 2.5 g each of the chlorite and phosphate. After a total reaction time of 24 hours, the mixture was extracted 3 times with dichloromethane, then the aqueous phase was acidified to pH 2 with aqueous HCl, and extracted once more. The combined organic extracts were washed with water, dried, and evaporated to leave a solid residue that was boiled in 2-propanol. After cooling, the solids were collected by filtration, washed with a little

-168-

2-propanol, and dried to leave 2.21 g (87%) of 2-bromo-1-methylindole-3-carboxylic acid [XXVII: $R_1 = H$, $R_3 = CH_3$, $X = Br$] as a beige solid; mp ca. 198°C (dec), in 2 crops.

5 A suspension of 2.54 g (10 mmol) of 2-bromo-1-methylindole-3-carboxylic acid [XXVII: $R_1 = H$, $R_3 = CH_3$, $X = Br$], 2.54 g (10 mmol) of bis(2-oxo-3-oxazolidinyl)phosphinic chloride, 2.78 mL (20 mmol) of triethylamine, and 25 mL of 10 1,2-dichloroethane was heated at reflux for 1.5 hours. The mixture was cooled and poured into 150 mL 5% aqueous sodium bicarbonate solution and stirred for 30 minutes. The mixture was extracted with 15 dichloromethane (3 times), the combined organic phase washed with water, brine, dried ($MgSO_4$), and concentrated to leave a red oil. The oil was triturated in ethyl acetate:hexanes and the solids were collected by filtration to give 0.95 g of a side product; mp 227-228°C (dec). The filtrate was 20 concentrated to a viscous oil that was dissolved into chloroform and adsorbed into 9 g of flash SiO_2 . This was introduced onto a column containing flash SiO_2 and the column was eluted with hexanes:ethyl acetate (95:5). Product fractions were pooled, concentrated, 25 and triturated from isooctane to give 1.96 g (63%) of 2-bromo-1-methylindole-3-carboxylic acid, t-butyl ester [XXVIII: $R_1 = H$, $R_2 = COO-t-butyl$, $R_3 = CH_3$] as a white solid; mp 87-88°C.

complex (1.5 M in ether). The flask was opened to the air and with a brisk stream of N₂, the resultant white suspension was warmed to ca. 85°C to distill off the ether and most of the THF. The residual semi-solid was cooled in an ice bath and diluted with 1.5 mL of DMA followed by 155 mg (0.5 mmol) of 2-bromo-1-methylindole-3-carboxylic acid, t-butyl ester. The resultant solution was stirred at room temperature for 24 hours, cooled to 0°C, then treated with 2 mL of dilute acetic acid. The mixture was diluted with water and extracted with chloroform (3 x 10 mL). The combined extracts were washed with water (4 times), dried (Na₂SO₄), and concentrated to leave a golden solid. The solid was suspended in 2.3 mL of 2:1 v/v HOAc:H₂O and the suspension was treated with 154 mg of NaBO₃·4H₂O, then stirred at 25°C for 30 minutes. The solids were collected by filtration, washed with water, and dried to leave 119 mg (77 %) of 2,2'-diselenobis[1-methyl-1H-indole-3-carboxylic acid, t-butyl ester] (129) [XXIX: R₁ = H, R₂ = COO-t-butyl, R₃ = CH₃]; mp 187-189°C. ¹H NMR (CDCl₃): δ 8.13 (1H, dd, J = 0.7, 7.9 Hz, H-4), 7.31-7.19 (3H, m, ArH), 3.63 (3H, s, NCH₃), 1.44 (9H, s, C(CH₃)₃). Compound 135 of Table 1

A mixture of 2.09 g (10 mmol) of 2-chloroindole-
 10 3-N-methylcarboxamide [XXX: $R_1 = R_3 = R_6 = H$, $R_7 = CH_3$,
 $X = Cl$], 1.72 g (10 mmol) of 2-diethylaminoethyl
 chloride hydrochloride ($n = 2$, $Q = Cl$, $R_8 = R_9 = Et$),
 7.5 g (23 mmol) of anhydrous cesium carbonate, 3 g of
 activated 3A molecular sieves, and 20 mL of acetone was
 15 stirred under nitrogen at 25°C for 16 hours. The
 mixture was filtered over celite and the filtrate was
 concentrated to a solid that was partitioned between
 chloroform and water. The organic phase was dried
 (Na_2SO_4) and concentrated to a residue that was
 20 crystallized from ethyl acetate:hexanes (5:8). The
 solids were collected and dried to leave 1.43 g of
 2-chloro-1-[2-(diethylamino)ethyl]-N-methyl-1H-indole-

EXAMPLE L

Preparation of Compound 136 of Table 1 by the method outlined in Scheme 11.

10 An ice-cold solution of 15 g (50 mmol) of the N-trifluoroacetamide of D-tryptophan, synthesized by methods previously outlined (J. Org. Chem. 1979;44:2805-2807) in 50 mL of THF under N_2 was treated sequentially with 7.1 g (52.5 mmol) of 1-hydroxybenzotriazole then 10.83 g (52.5 mmol) of 1,3-dicyclohexylcarbodiimide. After 15 minutes, the solution was
15 treated with 5.74 mL (52.6 mmol) of benzylamine. The solution was maintained at 0-5°C for 1 hour, then let warm to 25°C overnight. The mixture was filtered and the collected solids were washed with ethyl acetate.
20 The filtrate was concentrated to an oil that was dissolved in 250 mL of ethyl acetate. The solution was washed sequentially with 250 mL portions of 10% aqueous acetic acid, water, 5% aqueous sodium hydrogen
25 carbonate, water and brine, then dried ($NaSO_4$), and concentrated to a solid. Crystallization from 170 mL of 65:35 2-propanol:petroleum ether afforded 12.81 g (66%) of (R)-N-(phenylmethyl)- α -[(trifluoroacetyl)-amino]-1H-indole-3-propanamide [II: $R_1 = H$, $R_2 =$
30 $CH_2CH(NHCOCF_3)CONHCH_2Ph$, $R_3 = H$] as an off-white solid which was used directly in the next reaction; mp 186-188°C.

To an ice-cold solution of 10 g (25.7 mmol) of (R)-N-(phenylmethyl)- α -[(trifluoroacetyl)amino]-

-177-

1*H*-indole-3-propanamide [XXIX: $R_1 = H$, $R_2 =$
 $CH_2CH(NHCOCF_3)CONHCH_2Ph$, $R_3 = H$] in 70 mL of THF was
added dropwise Se_2Cl_2 . The resultant deep red
suspension was stirred at 0-5°C for 4 hours, then
5 quenched with 300 mL of water. The solids were
collected by filtration, washed well with water, and
air dried to leave 12 g of impure product as an orange
solid. A portion of this material (10.7 g) was
dissolved in 100 mL of methanol and the solution under
10 N_2 was cooled in an ice bath. Sodium borohydride
(ca 1 g) was added portionwise until there was no more
color discharge. The mixture was poured immediately
into a N_2 purged separatory funnel containing 200 mL of
ether. The mixture was diluted with 200 mL of water,
15 the mixture shaken, and the phases separated. The
aqueous layer was treated with a small portion of
additional sodium borohydride, extracted again with
ether, ice-cooled, then acidified to pH 1 with
concentrated HCl. The aqueous phase was extracted
20 twice with ethyl acetate, then the combined extracts
were dried ($MgSO_4$) and filtered through a pad of flash
silica gel. The filtrate was concentrated to leave
5.91 g of a foam that was dissolved in ca 40 mL of
absolute ethanol. The solution was kept at 25°C for
25 several hours to initiate crystallization, then stored
at 5°C. The solids were collected by filtration,
washed with 2-propanol, and dried to leave 4.23 g of
pure [R-(R*,R*)]-2,2'-diselenobis[N-(phenylmethyl)-
 α -[(trifluoroacetyl)amino]-1*H*-indole-3-propanamide]
30 [XXIX: $R_1 = H$, $R_2 = CH_2CH(NHCOCF_3)CONHCH_2Ph$, $R_3 = H$],
as a yellow powdery solid; mp 181-185°C.
Analysis calculated for $C_{40}H_{34}N_6O_4F_6Se_2 \cdot H_2O$ requires:
C, 50.43; H, 3.81; N, 8.82%.
Found: C, 50.47; H, 3.57; N, 8.71%.

Further processing of the filtrate by chromatography over flash SiO₂, eluting first with dichloromethane then 7% ethyl acetate in dichloromethane, provided an additional 671 mg of product following crystallization; mp 180-183°C.

A suspension of 233.5 mg (0.25 mmol) of this diselenide in 4.5 mL of dry absolute ethanol was treated with 95 mg (2.5 mmol) of sodium borohydride. The mixture was heated at reflux for 15 minutes, then treated with 95 mg of additional borohydride. The mixture was refluxed for 1.25 hours, then treated with a third 95 mg portion of borohydride. After refluxing for 30 minutes, the mixture was cooled to 25°C, diluted with methanol, and poured into an ice-cold stirring mixture of 6N HCl and ethyl acetate. The resultant mixture was stirred vigorously for 15 minutes, filtered, the phases separated, and the aqueous layer extracted once more with ethyl acetate. The combined ethyl acetate phases were then back extracted with 5% aq HCl (five times). The acidic aqueous layers were combined and diluted with an equal volume of ethyl acetate. While carefully monitoring the pH, the stirred solution was treated carefully with 10% aqueous NaOH until pH = 9.5. The resultant yellow precipitate was collected by filtration, washed well with water, and dried to leave 90 mg of [R-(R*,R*)]-2,2'-diselenobis[α -amino-N-(phenylmethyl)-1H-indole-3-propanamide] (136) [XXIX: R₁ = H, R₂ = CH₂CH(NH₂)CONHCH₂Ph, R₃ = H], as a yellow powder; mp 172-174°C.

10 Compound 137 of Table 1

Starting from the *N*-trifluoroacetamide of
L-tryptophan (*J. Org. Chem.* 1979;44:2805-2807) and
following the same procedures as outlined for the
synthesis of compound 136 of Table 1, there was
15 obtained [S-(R*,R*)]-2,2'-diselenobis[α-amino-
N-(phenylmethyl)-1*H*-indole-3-propanamide] (137)
[XXIX: R₁ = H, R₂ = CH₂CH(NH₂)CONHCH₂Ph, R₃ = H] as a
yellow powder; mp 171°C (dec).

EGF Receptor Tyrosine Kinase Assay

20 Membrane vesicles were prepared by the method described in Cohen S, Ushiro H, Stoscheck C, and Chinkers M. A native 170,000 epidermal growth factor receptor-kinase complex from shed plasma membrane vesicles, J. Biol. Chem. 1982;257:1523-1531, and kept

25 frozen at -90°C until use. At the time of assay, membranes were solubilized in 4% Triton X-100 and 10% glycerol. The reaction is carried out in wells of a 96-well microtiter plate in a total volume of 125 L. Buffer containing 20 mM Hepes (pH 7.4), 15 mM MgCl₂,

30 4 mM MnCl₂, and 0.02% BSA followed by 5 to 20 mg of membrane protein and 150 ng of epidermal growth factor. The plates are incubated for 10 minutes at room temperature to activate the receptor kinase. 20 g

35 of GAT (random polymer of glycine, alanine, and tyrosine) and 0.2 mCi of α-[P³²] ATP plus or minus

-185-

compound are added and incubated 10 minutes at room temperature. The reaction is stopped by addition of 125 mL of 30% TCA, precipitate washed twice with 200 mL of 15% TCA on 0.65 micron filters, and the filters counted by scintillation spectrometry.

PDGF Receptor Tyrosine Kinase Inhibition Assay

Recombinant baculovirus containing human PDGF β receptor intracellular tyrosine kinase domain was used to infect SF9 cells to overexpress the protein, and cell lysates were used for the assay. The ability of the tyrosine kinase to phosphorylate glutamate - tyrosine substrate in the presence of P^{32} -ATP and inhibitor was measured by counting the incorporation of P^{32} in Glu-Tyr in TCA precipitable material.

Table 2 provides representative data on inhibition of the PDGF receptor tyrosine kinase. In Table 2, No. refers to the compound number as recorded in Table 1.

DETAILED STUDIES ON THE BIOLOGICAL EFFECTS OF COMPOUNDS 21 AND 70

Effects on Cells in Tissue Culture

Swiss 3T3 fibroblasts, that were growth arrested in serum-free media for 24 hours, were exposed to various concentrations of compound for 2 hours. The cells were then exposed to individual growth factors for 5 minutes and proteins that were phosphorylated on tyrosine in response to the mitogens and were detected by Western blotting techniques using phosphotyrosine antibodies. Similar techniques were used for tumor cell lines except the time in serum-free media was increased.

-186-

At concentrations of 10 to 50 mM, Compound 21 suppressed: (1) EGF mediated phosphorylation of a variety of endogenous proteins; (2) PDGF mediated autophosphorylation of the PDGF receptor as well as PDGF mediated tyrosine phosphorylation of other endogenous proteins and; (3) bFGF mediated tyrosine phosphorylation. 70 was more selective and inhibited only bFGF mediated tyrosine phosphorylation and at concentrations as low as 2 mM.

Effects on Growth Factor Mediated Mitogenesis

Swiss 3T3 fibroblasts, that were growth arrested in serum-free media for 24 hours, were exposed to various concentrations of compound for 2 hours. The cells were then exposed to individual growth factors for 24 hours and mitogenesis assessed by measuring tritiated thymidine incorporation into DNA.

The concentration of 21 and 70 required to inhibit growth factor mediated mitogenesis by 50% for the following growth factors was as follows:

Growth Factor	IC ₅₀ (μM) for 21	IC ₅₀ (μM) for 70
EGF	2	3
PDGF	8	4
bFGF	13	3
serum	19	3

Growth Inhibition Assay

Swiss 3T3 mouse fibroblasts were maintained in dMEM/F12 media containing 10% fetal calf serum. Two mL of cells at a density of 1 x 10⁴/mL were placed in 24-well plates plus or minus various concentrations of

-187-

the inhibitor. The cells were grown at 37°C under 5% CO₂ for 72 hours and then counted by Coulter counter. The data were expressed as the concentration of inhibitor necessary to decrease the growth rate by 50%.

5 Compound 21 was growth inhibitory for a variety of human tumor cell lines as well as the Swiss 3T3 fibroblasts. The concentration of 21 necessary to inhibit cell growth by 50% is shown below:

Although the carboxyl containing structures are among the most active enzyme inhibitors, they are poorly transported into the cell, whereas the less
25 active esters are transported efficiently and once in the cytoplasm rendered highly active by esterases. Esters may, therefore, be more favorable than carboxylic acids in this invention.

The data of Table 2 show that the 2-thioindoles
30 of general Formula I listed in Table 1 include compounds which are active as potent inhibitors of protein tyrosine kinases and as cytotoxic agents.

The invention is not limited to the particular embodiments shown and described herein, since various
35 changes and modifications may be made without departing

-188-

from the spirit and scope of the invention as defined
by the following claims.

 ethyl 3-(1-methyl-2-thioxo-3-indoliny)-
 propanoate,
- 15 N-benzyl 3-(2-thioxo-3-indoliny)propanamide,
 4-(2-thioxo-3-indoliny)butanoic acid,
 4-(1-methyl-2-thioxo-3-indoliny)butanoic
 acid,
- 20 methyl 4-(2-thioxo-3-indoliny)butanoate,
 methyl 4-(1-methyl-2-thioxo-3-indoliny)-
 butanoate,
- N-phenyl (1-methyl-2-thioxo-3-indoliny)-
 carboxamide,
- N-phenyl (1-methyl-2-methylthio-3-indoliny)
 carboxamide,
- 25 3-benzoyl-1-methyl-2-indolinethione,
 3-(4'-carboxybenzoyl)-1-methyl-
 2-indolinethione,

 bis[5-methylindolyl-3-propanoic acid-(2)]-
 disulfide,
20 bis[ethyl-5-methylindolyl-3-propanoate-(2)]-
 disulfide,
 bis[6-methylindolyl-3-propanoic acid-(2)]-
 disulfide,
 bis[ethyl-6-methylindolyl-3-propanoate-(2)]-
25 disulfide,
 bis[7-methylindolyl-3-propanoic acid-(2)]-
 disulfide,
 bis[ethyl-7-methylindolyl-3-propanoate-(2)]-
 disulfid ,

-193-

- 30 2,2'-dithiobis[N-benzyl-3-(3-indolyl)-
propanamide],
bis[indolyl-3-butanoic acid-(2)]disulfide,
2,2'-dithiobis[4-(1-methyl-3-indolyl butanoic
acid),
35 bis[methyl indolyl-3-butanoate-(2)]disulfide,
bis[methyl 1-methylindolyl-3-butanoate-(2)]-
disulfide,
bis[N-phenyl 1-methylindolyl-3-carboxamide-
(2)]disulfide,
40 bis[N-phenyl 1-ethylindolyl-3-carboxamide-
(2)]disulfide,
bis[N-phenyl 4-chloro-1-methylindolyl-
3-carboxamide-(2)]disulfide,
bis[N-phenyl 5-chloro-1-methylindolyl-
3-carboxamide-(2)]disulfide,
45 bis[N-phenyl 7-chloro-1-methylindolyl-
3-carboxamide-(2)]disulfide,
bis[N-phenyl 1-methyl-7-azaindolyl-
3-carboxamide-(2)]disulfide,
50 bis[N-phenyl 1,4-dimethylindolyl-
3-carboxamide-(2)]disulfide,
bis[N-phenyl 1,5-dimethylindolyl-
3-carboxamide-(2)]disulfide,
bis[N-phenyl 1,6-dimethylindolyl-
3-carboxamide-(2)]disulfide,
55 bis[N-phenyl 1,7-dimethylindolyl-
3-carboxamide-(2)]disulfide,
bis[N-phenyl 4-methoxy-1-methylindolyl-
3-carboxamide-(2)]disulfide,
60 bis[N-phenyl 5-methoxy-1-methylindolyl-
3-carboxamide-(2)]disulfide,
bis[N-phenyl 6-methoxy-1-methylindolyl-
3-carboxamide-(2)]disulfide,

-194-

65 bis[N-phenyl 7-methoxy-1-methylindolyl-
 3-carboxamide-(2)]disulfide,
 bis[N-methyl 1-methylindolyl-3-carboxamide-
 (2)]disulfide,
 bis[N-benzyl 1-methylindolyl-3-carboxamide-
 (2)]disulfide,
 70 bis[N-methylphenylsulfonyl)-2-indolyl]-
 disulfide,
 bis[3-benzoyl-1-methylindole-(2)]disulfide,
 bis[3-(4'-carboxybenzoyl)-1-methylindole-(2)]-
 disulfide,
 75 bis[3-(4'-carbomethoxybenzoyl)-
 1-methylindole(2)]disulfide,
 and pharmaceutically acceptable salts thereof.

4. A pharmaceutical composition useful for inhibition
 of protein tyrosine kinase dependent disease in a
 mammal, containing in a pharmaceutically
 acceptable carrier a therapeutically effective
 5 amount of a compound selected from 2-thioindole,
 2-indolinethione, and polysulfide compounds
 represented by the general Formulas I and IV

15 and pharmaceutically acceptable salts thereof,
 wherein

R_1 is a member selected from H, halogen, R,
 OH, OR, CF_3 , NO_2 , NH_2 , NHR , $COOH$, $CONHR$, $(CH_2)_nOH$,
 $(CH_2)_nOR$, $(CH_2)_nNH_2$, $(CH_2)_nNHR$, and $(CH_2)_nNRR$, and

-195-

further represents replacement in the ring of 1 or
2 ring methine (-CH=) atoms with aza (-N=) atoms;

R₂ is a member selected from

C₂₋₄ alkyl,
(CH₂)_nCOOH,
(CH₂)_nCOOR,
(CH₂)_nCOR,

 1, 2, or 3, X is a member selected from H, lower
 60 alkyl, benzyl, and benzene, pyridine, thiophene,
 furan, thiazole, and imidazole rings, and Q is
 another 2-thioindolyl moiety of Formula I.

5. A pharmaceutical composition useful for treating
 aberrant cell growth in a mammal containing in a
 pharmaceutically acceptable carrier a
 therapeutically effective amount of a compound
 5 selected from 2-thioindole, 2-indolinethione, and
 polysulfide compounds represented by the general
 Formulas I and IV

15 and pharmaceutically acceptable salts thereof,
 wherein

R₁ is a member selected from H, halogen, R,
